

# Is your personal information exposed on the dark web?

At Allstate Identity Protection, we do more than just “scan” the dark web. Our human operatives and artificial intelligence search for members’ compromised credentials and other personal data. Then we provide actionable alerts to members who have been compromised.

## What is the dark web?

The dark web is part of the internet not indexed by search engines and not accessible through normal internet browsers. It is most commonly accessed through Tor, a dark web browser which conceals a user’s location and allows them to remain anonymous. The dark web is a popular breeding ground for illicit content and activity, black markets, and hacker exchanges.

## Dark web crawlers catch data

While human operatives interact in closed forums, bots crawl the dark web looking for everything from compromised credentials to data dumps to hacker chatter. Experts then exfiltrate files of compromised credentials from closed forums and alert members when they’re exposed, so they can protect themselves.

## What makes our monitoring unique?

We utilize experienced human operatives who have access to closed forums where hackers and threat actors communicate and exchange data. This allows us to search an exclusive layer of information for compromised personal data on behalf of our members. We have the ability to alert a member about compromised information weeks or even months before a breach is ever made public.

## Help halting botnets

Our operatives infiltrate organized botnets to extract keylogger information, which shows us when member computers are infected and controlled. We alert those people so they can take the necessary actions to stop the flow of data from their computer to the botnet.
